RASD and DD Updates

Simone Graziussi

25th January 2015

Some small changes for the RASD and DD documents were made during implementation.

## RASD

- dropped the constraint that didn't allow to create events in the past: it's not a common action but it was pointless to deny it if the user wants to
- in the implemented application there's no check about time consistency for events (at each time interval there could be more than one event): it wasn't required in the specification
- in some parts of the RASD it was stated that the user could check the weather forecast for the next few days outside the event list: in the application the weather forecast is only linked to events so it's visible only if there are some events (and the forecast was available at creation)

## DD

- the "NotificationDetails" and "EventDetails" screens are not independent pages like described in the UML diagrams but have been embedded inside the Registered User Home, since there was no need to expand them in external pages
